Toward a Theory of Coordinating Mechanisms in Practice

Paula A. Jarzabkowski, Jane K. Lê, Martha S. Feldman

Published Online: 19 Oct 2011 | <https://doi.org/10.1287/orsc.1110.>

Abstract

This paper uses a practice perspective to study coordinating mechanisms that are continuously created and modified in order to enact organizational change based on the case of Servico, an organization undergoing a major response to a change in government regulation. In our case, the concept of a coordinating mechanism referred to as end-to-end practice. They do this via five performative-ostensive cycles:

Abstract

Qualitative research crucially contributes to knowledge generation via theory development, refinement, and refutation. A plethora of resources exist facilitating raw data engagement and immersion strategies. Yet, advanced analytic techniques for deriving theoretical insight are scanty understood and documented in the methods literature. The current paper creates a procedural framework for advancing theoretical insight via the use of qualitative analytic techniques by collating insights from the groundbreaking work of [Klag and Langley](#), [Langley](#), [Locke et al.](#), and [Locke](#)—which builds heavily on [Peirce's](#) work on abduction and [Weick's](#) work on disciplined imagination. We construct this framework around three core processes: challenging, seeing, and articulating. We provide three practical examples from our own research projects to demonstrate how these core processes are supported by advanced analytic techniques. We discuss the impact of different theorizing goals, different epistemological grounding, future applications, and further methodological development.

Background and Purpose

A core goal, if not the core goal, of qualitative research is theory development and refinement (Bansal et al., 2018; Gephardt, 2004; Pratt, 2008; Pratt & Bonaccio, 2016). Yet, processes of theorizing from qualitative research are rarely explicitly described in journal publications and thus frequently remain shrouded in mystery (Klag & Langley, 2013; Locke et al., 2008). There is no shortage of instructional materials (e.g., textbooks, book chapters, journal articles, online tutorials) that describe analytic techniques related to getting to know and managing one's raw data and summarizing its core content (i.e., texts on coding, extraction of themes, case summaries, content categorization). However, methodological treatments of more advanced analytic processes that focus on building insights from those initial raw data analyses in order to generate theory are largely lacking (Klag & Langley, 2013; Locke et al., 2022).

Groundbreaking articles—such as the ones by Weick (1989) on disciplined imagination, by Klag and Langley (2013) on conceptual learning, and by Locke et al. (2008) on the generative role of doubt—have provided the

Abstract

Debates about how generative artificial intelligence will impact the practice of qualitative methods largely focused on how generative artificial intelligence may be used to collect and analyse data, a the ethical implications of doing so. In this article, we shift attention to a less-examined but vital a: qualitative research: the interpretation – or theorization – of empirical patterns. We argue that ge artificial intelligence's core capabilities – autoregressive generation, self-attention, and latent know make it particularly well-suited to augment qualitative theorization. Based on an understanding of qualitative theorization as disciplined imagination, we elucidate how generative artificial intelligen support this process by expanding and enriching imagination and broadening and scaffolding disi offer practical guidance on how to prompt generative artificial intelligence to realize these benefit also identifying potential pitfalls and how to avoid them. Ultimately, we contend that, although ge artificial intelligence is no substitute for human interpretation, it represents a powerful tool for ex and structuring the theorization process.

Abstract

As artificial intelligence capabilities expand beyond pattern recognition to theoretical insight generation, interpretive qualitative research confronts a question of epistemic responsibility: how can scholars integrate artificial intelligence capabilities while remaining accountable for their theoretical interpretations? This essay proposes "interpretive orchestration" as a framework that transforms researchers from analysts into skilled orchestrators of human-artificial intelligence collaboration. The framework addresses two challenges that become opportunities. The translation challenge of articulating tacit knowledge (theoretical orientations, contextual understanding, and embodied intuition) into forms that artificial intelligence can process deepens researchers' awareness of their own expertise. The judgment challenge of evaluating artificial intelligence-generated patterns for theoretical significance highlights the accountability our scholarly communities require, particularly through "1.5-order data": patterns invisible to human perception yet requiring human interpretation for recognized theoretical significance. Three strategic models guide this orchestration: Socratic tension surfaces implicit assumptions through deliberate contradiction; Euclidean documentation enables reproducible analysis through systematic context-building; Vitruvian mastery reads across independent analytical passes for synthetic insight. By embracing orchestration, researchers discover that artificial intelligence can amplify rather than replace human capability. The future of interpretive research lies neither in rejecting artificial intelligence nor surrendering to automation but in systematic approaches to human-artificial intelligence collaboration that preserve the scholarly accountable judgment our communities require while drawing on artificial intelligence's capacity to generate theoretical insights across scales humans cannot process alone.

What is Qualitative Research?

Denzin & Lincoln (2005: 3)

Qualitative research **is a situated activity** that locates the observer in the world. It consists of a set of **interpretive, material practices** that make the world visible. These practices transform the world. They turn the world into a series of representations, including field notes, interviews, conversations, photographs, recordings, and memos to the self. At this level, qualitative research involves an **interpretive, naturalistic approach** to the world. This means that qualitative researchers study things in their natural settings, attempting to make sense of, or **interpret, phenomena in terms of the meanings people bring to them.**

What is Qualitative Research?

Characteristics

- **Social construction** — construction of meaning within socially situated practices
- **Skilled** — studied, enacted, practice
- **Pluralistic** — privileges no single methodological practice over another
- **Nuanced** — rich and fine grounded naturalistic accounts
- **Complex** — embraces tensions, contrasts, negative cases
- **Social** — human-to-human relationship constructs 'social' reality
- **Reflexive** — reflexivity, multiple voicing, representation, presentation
- **Iterative** — attention to the process of doing qualitative research

Are you really doing qualitative research?

Qualitative data vs. qualitative analysis

Kenneth Gergen (1978: 1344) riled against traditional positivist empiricist assumptions arguing they produced highly restrictive designs and curtailed the field.

Flick (2002: 3): "Rapid social change and the resulting diversification of life worlds are increasingly confronting social researchers with new social contexts and perspectives...traditional deductive methodologies... are failing...thus research is increasingly forced to make use of inductive strategies...knowledge and practice are studied as local knowledge and practice" (p. 2).

03

Provocation

Can AI really do that?

AI as the Magic Bullet

- Solves our methods problems (e.g., removes research bias; supplements expertise)
 - Increases speed and allows multiplies outputs
 - Absolves us from data work (e.g., coding/analysis)
 - Theorizes for us
 - Writes manuscripts for us
- **A promise made** (faster, better science) **is often not a promise kept** (sloppy ‘good enough’ science)

But is that Happening?

“Scientific fraudsters massively outproduce careful researchers”

<https://blogs.lse.ac.uk/impactofsocialsciences/2026/03/17/research-integrity-is-locked-into-an-arms-race-with-agentic-ai-slop/>

GenAI is not a Method

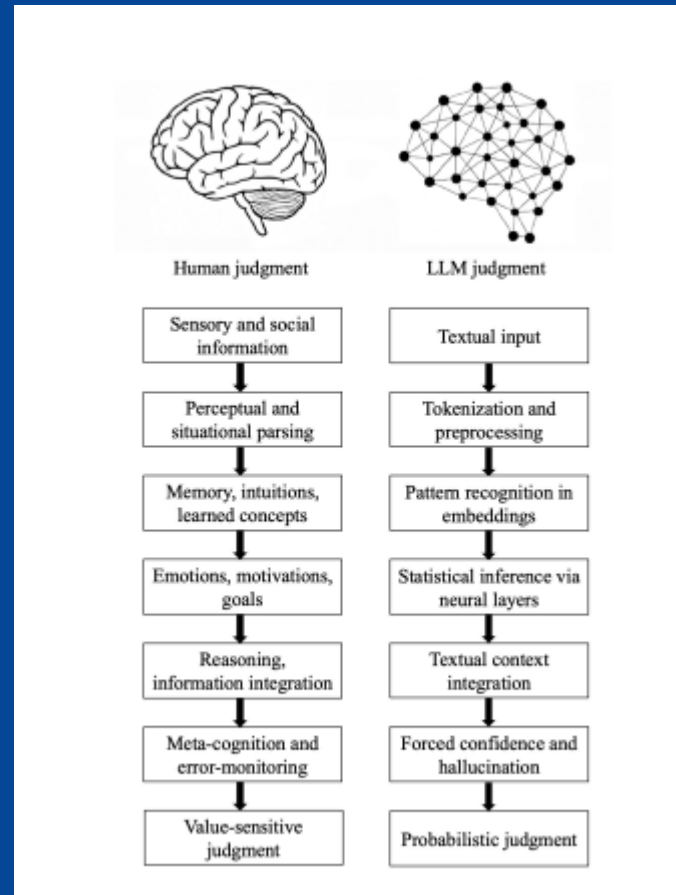

Definition

To be a method, there needs to be a systematic, repeatable approach that can be applied across different research projects with predictable types of outcomes that are driven by the specific steps taken in the analysis process. The analytic process needs to be known and malleable by the researcher.

- Problem 1: Writing prompts is not an analytic process
- Problem 2: Most people do not know how the genAI operates
- Problem 3: Many people do not understand the principles they want to apply

Probabilistic Judgement is not Interpretation

Quattrocioni, Capraro & Perc (2025)

And it Gets Worse

Violating Key Assumptions of Qualitative Research

- Qualitative research is not just text analysis!
 - genAI or LLM based research does not analyze text; it produces a **quantitative** probabilistic calculation of a word string that looks similar to the training data provided
- Practically no engagement with qualitative method (e.g., grounded theory, discourse analysis).
 - How would a particular qualitative method be suitably carried out with genAI following the prescribed analytic processes of that method?
- No consideration of ontological and epistemological groundings at all!
- No engagement with researcher positionality while interacting with the data, participants, or context.

And Worse

Some Problems

- Many of the genAI methods pieces (even if they come from big name researchers and are published in reputable journals) are **OPINION PIECES not TRUE METHODS**
- Many researchers in this space have a commercial interest in genAI (that includes other academics and researchers)
- Many of the outputs genAI creates look like analytical outputs; that doesn't mean it actually ran any analysis or that it even can

What would ChatGPT say?

I definitely absolutely can and would you like to try?

- I'm not designed to have human-style independent judgment or firsthand understanding.
- I don't have lived experience, embodied understanding, or a researcher's situated relationship with participants and context.
- I can independently produce an interpretation of qualitative data, but whether that constitutes the kind of interpretation your methodology considers valid is an epistemological and methodological question.
- The more difficult question—and I suspect this is what you're ultimately getting at—is whether an LLM can generate genuinely emergent concepts, rather than merely recombining conceptual patterns it has already learned from human language. That's a much harder question, and I wouldn't want to answer it with an unqualified yes.

What would Gemini say?

I definitely absolutely can and would you like to try?

- No AI cannot *genuinely* conduct interpretivist analysis in the epistemological sense.
- Interpretivism rests on the premise that knowledge is socially constructed through lived human experience, empathy, and shared cultural context. Because I lack subjective consciousness, lived experience, and genuine empathy, I cannot authentically "interpret" meaning. What I do instead is **advanced semantic pattern recognition**.
- Machine Pattern Matching Simulates "Coding"
- In qualitative methodology, coding is not mere data processing—it is an interpretative act where the researcher is the primary analytical instrument. Because I lack reflexivity and lived human experience, any "coding" I generate autonomously is just statistical grouping, not genuine qualitative analysis.

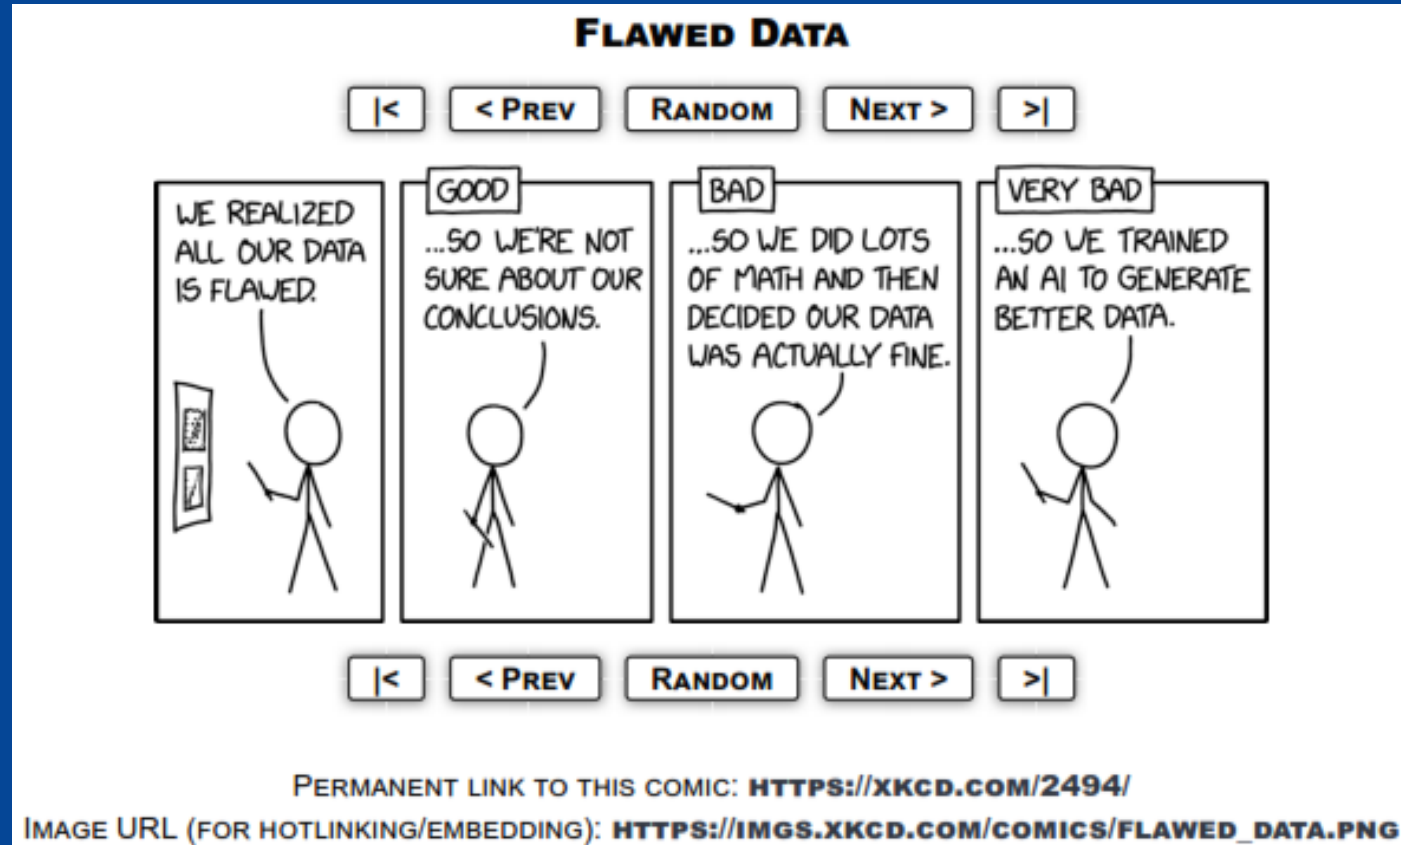

What would Claude say?

I definitely absolutely can and would you like to try?

- Interpretivism is about situated, subjective meaning-making — I don't have lived experience, so my "interpretations" are pattern-based inferences, not embodied understanding.
- There's a distinction between: (1) **Doing interpretivist analysis** — which requires a knowing subject who brings situated understanding, has a stake in the meaning-making, and can be reflexively aware of how their own position shapes what they see. Interpretation isn't just pattern extraction — it's meaning construction by someone. (2) **Producing outputs that look like the products of interpretivist analysis** — coded transcripts, theme clusters, memos that sound plausible. **I can do (2).**
- Whether that constitutes "interpretation" in the phenomenological sense interpretivism – The honest answer is probably no, not in the way Geertz or Denzin meant it.
- I shouldn't be described as doing the interpretivist work.

And

Synthetic... Everything?

04

Provocation

Is AI even a meaningful innovation?

Principles of Research Methods Innovation

Le & Schmid (2022)

- **Holistic innovation:** All aspects of a method are interdependent; true innovation involves crafting and implementing innovation in multiple parts of the research design
- **Transparency:** No credibility without excruciating clarity of description and audit trails; educate your audience
- **Method-theory entanglement:** Develop method and theory together; a methodological innovation should lead to new theorizing
- **Reflexivity:** Stay true to onto-epistemological assumptions of the research tradition a particular method is embedded in.

Principles of Research Methods Innovation

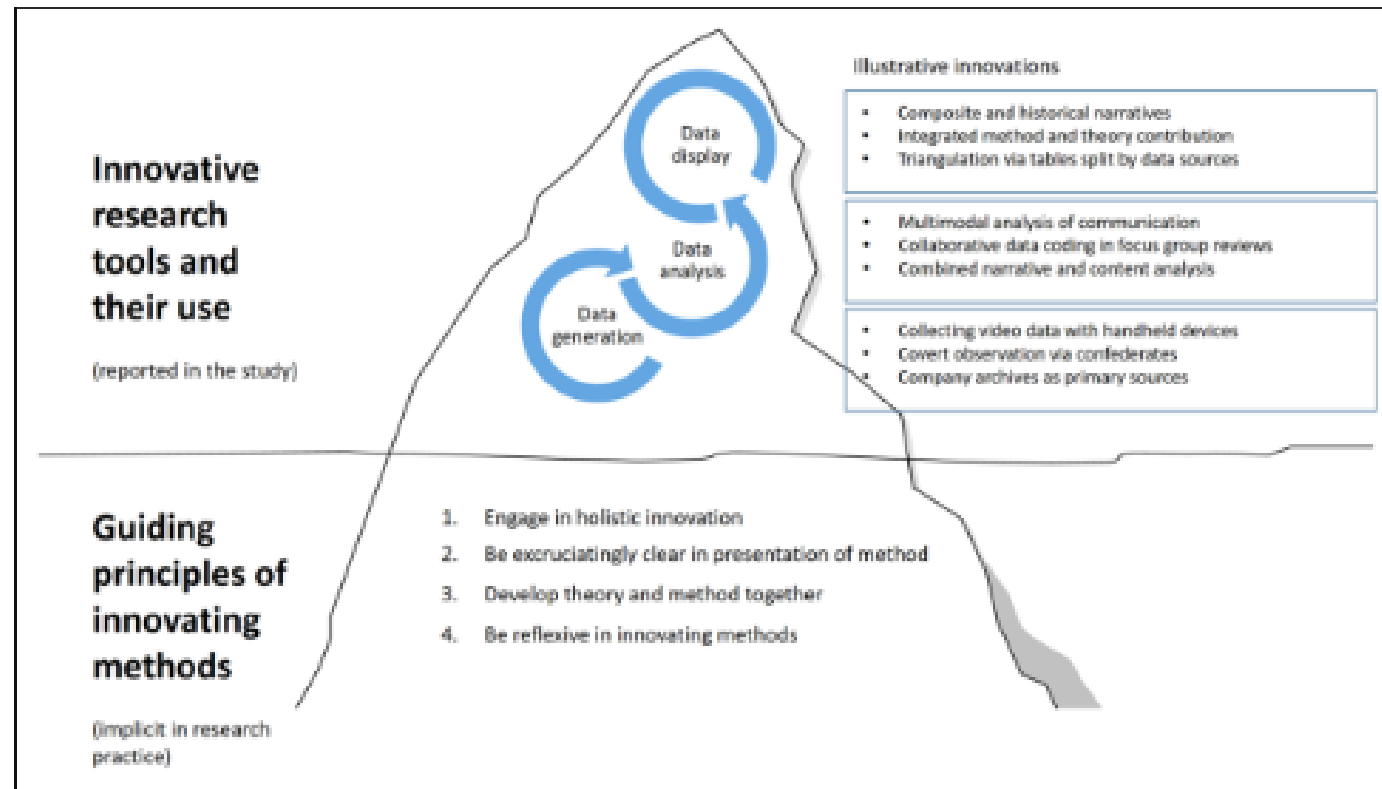

Figure 1. Innovating research methods as two-layered process ("innovation iceberg").

And

Back to Templates?

Le & Schmid (2022: 331)

“We should place the teaching of **proven methods alongside the development of practical skill**....This is critical to ensuring that methods retain the fluidity and flexibility with which they were created (e.g., Gioia, 2019), rather than simply becoming tools that **reproduce knowledge**. Hence, rather than teaching well-established research approaches as fixed templates, method trainings might use these as initial frameworks to orient and support students in order to later make creative use of established approaches for their own study.

Principles of Research Methods Innovation

Le & Schmid (2022)

- **Holistic innovation:** All aspects of a method are interdependent; true innovation involves crafting and implementing innovation in multiple parts of the research design
- **Transparency:** No credibility without excruciating clarity of description and audit trails; educate your audience
- **Method-theory entanglement:** Develop method and theory together; a methodological innovation should lead to new theorizing
- **Reflexivity:** Stay true to onto-epistemological assumptions of the research tradition a particular method is embedded in

Reigniting Old Debates

Recurrent Themes in Qualitative Research

- **Quality criteria**
- **Standardization / templating**
- **Legitimization**
- **Technology and tools**
- **Bias**
- **Natural science courting (positivism/reductionism)**

05

Provocation

Are we driving AI or is AI driving us?

The Danger of Epistemic Capture

Morley (2026); Ros & Wevers (2025); Zubcic (2023); Zubcic & Giacomini (2024)

- Epistemic capture is a phenomenon whereby domain-specific expertise generates constrained epistemological frameworks that come to dominate analytical and decision-making processes
- This epistemic dominance occurs when specialized knowledge frameworks acquire privileged status as authoritative truth claims, transcending their original contextual boundaries (Haas 1992)
- Cognitive filter and as an institutional mechanism, constraining the scope of what is considered to be realistic or evidence-based
- Shape research outcomes, the underlying research frameworks and research discourse itself (self-reinforcing feedback loops)

Technological Watershed Moment Needs Debate

Punctuated equilibrium

- “...these turbulent interchanges have produced profound challenges to the ways in which the social sciences are understood and practiced” (Gergen & Gergen, 2003: 575)

Concluding Thoughts

And

What Does that Mean?

Antonio Guterres (UN Secretary-General, July 2026)

“Some decisions must
remain forever human.”

Let's debate!
